

Practical No 4

Aim: Write a java program to demonstrate constructor overloading by creating multiple constructors with different parameters.

Source Code:

```
public class costudent{
    String name;
    int age;
    String course;
    costudent(){
        name="unknown";
        age=10;
        course="Not Assigned";
    }
    costudent(String n){
        name=n;
        age=20;
        course="Not Assigned";
    }
    costudent(String n,int a){
        name=n;
        age=a;
        course="Not Assigned";
    }
    costudent(String n,int a,String c){
        name=n;
        age=a;
        course=c;
    }
    void display(){
        System.out.println("Name: "+name);
        System.out.println("Age: "+age);
        System.out.println("Course: "+course);
    }
    public static void main(String[] args){
        costudent s1=new costudent();
        costudent s2=new costudent("Pramod");
```

```
costudent s3=new costudent("Bharat",51);
costudent s4=new costudent("Chetan",25,"Computer Applications");

System.out.println("\nStudent 1 Details:");
s1.display();
System.out.println("\nStudent 2 Details:");
s2.display();
System.out.println("\nStudent 3 Details:");
s3.display();
System.out.println("\nStudent 4 Details:");
s4.display();
    }
}
```

Output:

Student 1 Details:

Name: unknown

Age: 10

Course: Not Assigned

Student 2 Details:

Name: Pramod

Age: 20

Course: Not Assigned

Student 3 Details:

Name: Bharat

Age: 51

Course: Not Assigned

Student 4 Details:

Name: Chetan

Age: 25

Course: Computer Applications
