

Practical 7

Aim: Write a Java program that defines an abstract class and an interface. Implement these in a subclass and demonstrate method implementation.

Source-Code:

```
abstract class Shape{
    public abstract void draw();
    public void display(){
        System.out.println("This is a shape");
    }
}
interface Color{
    void fillColor();
}
class Circle extends Shape implements Color{
    public void draw() {
        System.out.println("Drawing Circle");
    }
    public void fillColor() {
        System.out.println("Filling Circle with color");
    }
}
public class AbsImpDemo {
    public static void main(String[] args) {
        Circle c = new Circle();
        c.display();
        c.draw();
        c.fillColor();
    }
}
```

Output:

```
This is a shape
Drawing Circle
Filling Circle with color
```
