

Mini Project Topic: Online TG (Teacher Guardian) Form System using PHP

Project Title: Online TG (Teacher Guardian) Form Management System

Project Description

The Online TG Form System is a web-based application developed using PHP and MySQL. The system allows students to submit their Teacher Guardian (TG) information online instead of filling and submitting forms manually in offline mode.

Currently, students submit TG forms physically, which requires paperwork and manual record management. This project digitizes the complete TG form submission process and helps departments maintain student records efficiently.

Objectives of the Project

- To reduce paperwork in TG form submission.
- To provide an online platform for students to submit TG details.
- To maintain student records digitally.
- To help faculty members access student information easily.
- To improve data management and reduce manual errors.

Expected Output

- Students can submit TG forms online successfully.
- Faculty can manage and review forms digitally.
- Records are stored securely in the database.
- Manual paperwork is minimized.

Learning Outcomes

After completing this project, students will learn:

- PHP and MySQL integration
- CRUD Operations
- Form Handling and Validation
- Session Management
- Database Connectivity
- Authentication System Development
